

End Point Encryption

Securing devices is a key element of all organisations security infrastructure. Our customers rely on us to ensure they have the most robust technologies deployed which enable this security. Our consultants are skilled in ensuring that these technologies are deployed to enable staff to operate securely and effectively, with minimal impact on their daily routine.

Being focused on Microsoft technologies, BDS recommend the use of BitLocker for endpoint encryption. Our desktop consultants can devise a non-intrusive programme for the deployment of BitLocker, and where licencing allows, implement Microsoft BitLocker Administration and Monitoring (MBAM) to hold information about keys for the entire organisation.

In addition to securing the data on machines, BDS also work with best-of-breed anti-virus providers to complement the endpoint encryption and authentication services. Whether securing physical or virtual devices, our distribution agreements enable us to provide these solutions at the best possible price for our customers.
